

Allimax Nutraceuticals US Chicago Illinois LYME DISEASE STUDY

Mr. James Walton president announced the completion and results of our three month follow up study showing newly completed blood work on our LYME clinical study participants completed December 2006. A complete screening of all study participants doing the industry standard **WESTERN BLOT TEST** performed by **IGeneX Laboratories** proved our study group when tested fro IgM and IgG are negative. These are typical markers and indicate people who suffer from Lyme disease. This is astounding news for the Lyme community. The initial study had over a 90% eradication of symptoms and co- infections and now 3 months later the results are quite promising and provocative. We will continue monitoring and looking for cures to this devastating disease. Future follow up with the group will be done this year. We are looking to have our work published by year's end 2007.
